

Table 3C-11. Frequency of Stream Releases during Growing Season
Insufficient to Overcome Channel Losses (Percent of Years)

Alternative or Condition	Stream			
	Lee Vining	Walker ^a	Parker	Rush
Point of reference	0	100	100	0
No-Restriction Alternative	80	100	100	80
All other alternatives	0	0	0	0

Note: Growing season is May to August.

^a Walker Creek would be dry in lower reaches in March, April, and November in less than 10% of years for all alternatives because natural flow is insufficient. All other streams would have sufficient flows in all years.
